Dear Deloitte Hiring Team,

I'm applying for the Full-Stack Development Intern role within the Enterprise Security and Emerging Technology team, and I'd like to walk you through the projects that have shaped my capabilities over the past 12 months.

Full-Stack AI Web Application — My Highest-Impact Project

The project I'm most proud of is a full-stack AI application I designed and shipped end-to-end. The front-end was built with React, Next.js, and TypeScript using Tailwind CSS and shadcn components. The back-end was a FastAPI Python service exposing REST endpoints with async handling, Pydantic validation, and JWT-based authentication. At its core sat a RAG pipeline integrating Pinecone for vector search with the OpenAI and Anthropic APIs for grounded, context-aware responses. The entire system was containerised with Docker and deployed through a GitHub Actions CI/CD pipeline. My role was sole architect and developer — from system design through to live deployment.

AI Operations Internship — Production API Integration at Scale

At the AI for Developing Countries Forum (AIFOD), I've been building and maintaining live integrations with LLM inference APIs (Claude, GPT) in a real operational environment. This meant handling rate limits, token quota management, authentication flows, and error recovery in workflows that couldn't afford to fail — international AI events with speakers and stakeholders on the line. I also produced the technical documentation, runbooks, and process guides that kept the system maintainable. This experience taught me what separates a working integration from a production-ready one.

Multi-Agent Orchestration System

I built a multi-agent system using LangChain, CrewAI, and AutoGen implementing ReAct and Chain-of-Thought reasoning patterns — agents that plan, use tools, observe outcomes, and self-correct across multi-step workflows. I implemented governance controls including execution boundaries, role-based access, and full audit logging of AI actions. The measurable outcome: a system capable of autonomously executing complex document workflows that previously required hours of manual effort.

Published Research — Solana Web3 SaaS Platform

My final-year project resulted in a peer-reviewed publication at the ARTELLIGENCE 2025 International Conference on AI. I built a Solana-based SaaS platform combining Web3 wallet integration with an AI-powered content optimisation pipeline. The discipline of producing work rigorous enough to pass academic peer review is the same standard I bring to code quality, documentation, and technical communication.

What draws me specifically to this internship is the Enterprise Security context. Building AI-integrated systems that are also secure, governed, and compliant is the engineering challenge I find most interesting — and it's where my experience with OAuth2, API governance, rate limiting, and access controls is most directly relevant.

I graduated with a First Class with Distinction in AI & ML Engineering in 2025 and I'm based in Abu Dhabi with no relocation requirement. I'm available to start immediately.

I'd welcome the opportunity to contribute to Deloitte's emerging technology work and grow within a team of this calibre.

Warm regards,

Aamil Abdulla +971 56 846 1565 | aamilabdulla123@gmail.com linkedin.com/in/aamil-abdulla-868996248 | github.com/Aamil-Abdulla
